DETAILED ACTION

1. This office action is in response to the amendment of October 16, 2009.
2. The terminal disclaimer filed on October 16, 2009 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of US 6,939,112 B2 has been reviewed and is accepted. The terminal disclaimer has been recorded.

Allowable Subject Matter

3. Claim 1-3 are allowed.
4. The following is an examiner's statement of reasons for allowance: the prior art does not teach the limitations for a variable displacement compressor having a discharge chamber, a suction chamber and a crank chamber, a displacement control valve disposed at a position in a discharge pressure supply passageway communicating with the crank chamber from the discharge chamber, a fixed orifice provided at a position in a pressure relief passageway communicating with the suction chamber from the crank chamber, a pressure sensing member being expanded and contracted by sensing a pressure in the suction chamber or the crank chamber, a valve element having one end that is brought into contact with the pressure sensing member and a valve part opening and closing a valve hole formed in the discharge pressure supply passageway in response to an expansion/contraction of the pressure sensing member, a valve chamber in which the valve part is disposed, in combination with
 - a. a fixed partition wall disposed around the valve element at a position in an axial direction of the valve element,

Art Unit: 3746

- b. a pressure chamber which is partitioned from the valve chamber by the fixed partition wall and to which a pressure in the suction chamber acts, and
- c. a solenoid provided to the other end of the valve element controlling an opening degree of the valve part by increase/decrease of an electromagnetic force,
- d. wherein the pressure relief passageway from the valve chamber to the pressure chamber is continuously open and formed by a gap between the fixed partition wall and the valve element that does not establish a sliding resistance to the axial movement of the valve element.

The prior art of Kimura et al. US 2001/0003573 teaches a control valve for a variable displacement compressor including a pressure relief passageway 58 that puts a chamber 49 housing a pressure sensing element 51 sensing the pressure of a suction chamber 22 in communication with a chamber 47 in fluid communication with a crank chamber 15. Kimura does not teach a partition wall surrounding a valve element, separating a first chamber in communication with a crank chamber from a second chamber in communication with a suction chamber, defining a continuously open pressure relief passageway between the two chambers with a gap between the inner surface of the bore and the outer surface of the valve element.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
